

Plastic Component with a High Filling Grade

Abstract

For a plastic component with a high filling grade (1), which is connected to a basic body (5), it is provided, in order to avoid the occurrence of cracks in the plastic component under changing thermal conditions, that the plastic component (1) is not fixed directly to the basic body (5) but via at least one intermediary (12) made of elastic material, with the intermediary being embedded by a frictional and/or positive connection with at least one projection (24) in a groove or opening (28) of the plastic component (1).
